

Assignment 6 - Resource management patterns

- ③ Worker proxy
- ↳ monitors the health of the instances
 - ↳ keeps it running till the specified duration
 - ↳ reports failures to Job mgr., if any
- ① Job Mgr.'s responsibility is to ensure the desired number of resources are available for the required duration. In case of any failure, it requests for a new resource from the Res. Mgr.
- ② Job mgr. specifies the number of instances & the cloud provider to the Res. Mgr.
- ③ Res. mgr. is a singleton, responsible for creation and shutting down instances from the cloud providers. It implements the factory method pattern to create instances either from AWS or any other cloud provider. Res. mgr. implements a circuit breaker to ensure that if the conn. to the cloud provider is unavailable, it will retry after some duration & in case of 3 failed attempts it will throw a failed message.
- ④ Design a system with the requirements as above by using appropriate design patterns. Emulate different failure scenarios to test whether the system is working correctly. Prepare a short report explaining the design.
